Table A17: Reports coefficients from OLS regressions of beliefs. Instead of using neighborhood outcomes of adults of the same race and gender, for non-white(Black and Hispanic) respondents white adults of same gender is used, while for white respondents black or Hispanic adults of the same gender is used. Other independent variables include, academic ability measure, risky behavior, demographics, parental wealth and outcomes, peer attributes, county attributes, state fixed effects and adverse shocks. All standard errors are robust standard errors.

Table A22: Reports results from a Oaxaca Blinder decomposition. Only results for the explained portion for each group of coefficients is shown. The reference equation used to conduct the analysis pools low and high wealth youth together. Percent explained is calculated by dividing the explained portion of the difference in outcomes corresponding to each group of variables by the difference in mean outcomes between the groups.
